

SECTION 9. BUILDING JOPES SPARC CLIENT

The standard GCCS JOPES SPARC client is a SPARC with 64 Mbytes of RAM and approximately 2Gbytes of disk space. The limited amount of memory limits the number of applications that may be run simultaneously. The limited amount of disk space demands that the users select carefully which applications they wish loaded on the system. The majority of the JOPES applications will fit on the standard GCCS JOPES SPARC client with 2Gbytes of disk space.

Table 9-1 list all the JOPES application segments, the Teleconferencing segments, and the supporting segments that may be loaded on a JOPES application server. The segments are listed in alphabetic order versus order of installation. The segments listed below should be loaded first, in the order shown. This will address the requirements of all the remaining applications as well as the limited disk space requirements.

- Netscape
- JOPES Navigation
- ORACLE Apps Server Tools (or ORACLE NFS Application Server Tools)
- External Transaction Processor
- S&M (If it is to be loaded)
- Requirements Development and Analysis

The ORACLE NFS Application Server Tools segment should only be loaded if there is absolutely no disk space available for the ORACLE Apps Server Tools (170Mbytes) segment.
